Key Solutions for Digital Imaging

# viewSIGN

# Test and verify your monitor for color accuracy and use your screen as a soft proofing tool

**viewSIGN - soft proof and sign off the pdf**
viewSIGN speeds up the production process and reduces the need to generate expensive proofs.

Attach the X-Rite Eye-One (either the Eye-One-Pro or Display2) and run viewSIGN. viewSIGN reads the same colors as the Fogra Media Wedge or proofSIGN control strip and compares the colors against the target colors expected from the ICC CMYK profile chosen.

viewSIGN then gives the monitor a percentage score. Sign the pdf(s) showing the score and details of the state of the monitor.

Without having to print an expensive proof you'll save time and money. viewSIGN speeds up the production process allowing co-ordination of viewing conditions and improves collaboration between remote sites.

**viewSIGN is a soft proofing tool**
Calibrating and profiling your screen is the first step in using the monitor as a soft-proofing tool but you need to do more.

The best profiling tools allow for testing of the monitor profile they have created but re-testing the profile invariably produces a pass. This isn't soft proofing because it doesn't show whether the screen is able to emulate the target ICC CMYK color space. viewSIGN is able to do this. viewSIGN is the soft proofing solution that also allows you to commuicate how you have viewed the pdf.
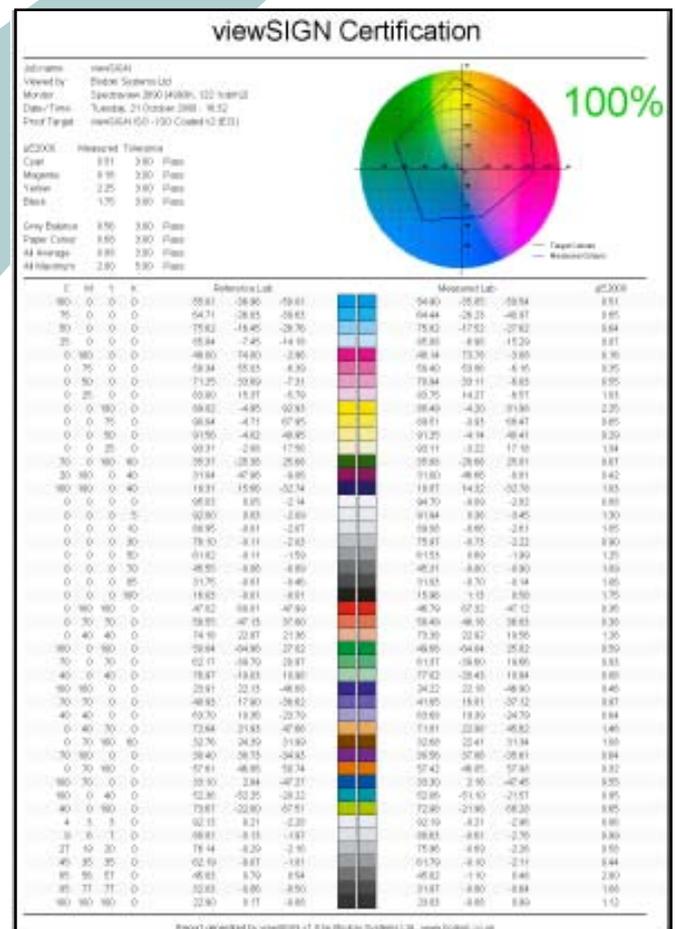

**viewSIGN approved reseller:**

viewSIGN digital signature is attached to the pdf showing all the information required to assess how the pdf was viewed.

viewSIGN certificate - optionally generate a certificate displaying a full report of the exact performance of your monitor.
